INTERNAL ENGINEERING REPORT

Langfuse Docs — Technical Issues Fix Report

DATE	BRANCH	PREPARED BY
2026-03-12	technical-issues	Engineering Team

11	6	4
FIXES APPLIED	DEFERRED	LAYERS

Executive Summary

11 fixes were applied across metadata, content, UX, and tooling layers. 6 issues were deferred as environment-level or large architectural changes that require separate planning.

- 11 fixes merged into branch
- 6 issues deferred for future planning

CONTENTS

- Fix 1 — metadataBase in root layout
- Fix 2 — og:url, canonical & seoTitle
- Fix 3 — buildPageUrl helper
- Fix 4 — seoTitle & ogVideo in schemas
- Fix 5 — ogVideo absolute URL handling
- Fix 6 — seoTitle on 4 overview pages
- Deferred 1 — Bundle size regression
- Deferred 2 — Sitemap canonical/noindex
- Deferred 3 — Inkeep search 403
- Fix 7 — H4→H3 heading accessibility
- Fix 8 — Feedback widget on FAQ pages
- Fix 9 — FAQ index sidebar label
- Fix 10 — md-to-pdf runtime + timeout
- Fix 11 — Untrack .source config
- Fix 12 — README updated
- Deferred 4 — Nextra compatibility shims
- Deferred 5 — Multiple content registries
- Deferred 6 — DocsLayout duplication

Applied Fixes

FIX 01 metadataBase added to root layout

High · Ch.2 / Ch.7

FILE

`app/layout.tsx`

PROBLEM

`metadataBase: new URL("https://langfuse.com")` was missing from the root Metadata export. Without it, Next.js cannot resolve relative URLs and cannot emit `og:url` automatically.

CHANGE

Added `metadataBase: new URL("https://langfuse.com")` as the first field of the metadata object.

ROLLBACK

Remove the `metadataBase` line from `app/layout.tsx`.

FIX 02 og:url, canonical tags, and seoTitle across all route metadata builders

High · Ch.7

FILES

`app/docs/[[...slug]]/page.tsx` `app/guides/[[...slug]]/page.tsx` `app/integrations/[[...slug]]/page.tsx` `app/self-hosting/[[...slug]]/page.tsx` `app/library/[[...slug]]/page.tsx` `app/[section]/[[...slug]]/page.tsx` `app/(wide)/WideSectionPage.tsx`

PROBLEM

Every route's `generateMetadata` function was missing `openGraph.url` (causing `og:url` to be absent on all pages) and `alternates.canonical` (causing canonical tags to disappear for pages without an explicit frontmatter override). Additionally, a new `seoTitle` field is now honoured for the HTML `<title>` when it differs from the sidebar navigation title.

CHANGES

- Added `buildPageUrl` import and computed `canonicalUrl` from params in each route.
- Set `alternates: { canonical: canonicalUrl }` (uses frontmatter override when present, otherwise self-referencing).
- Set `openGraph: { ..., url: canonicalUrl }`.
- Used `pageData.seoTitle || page.data.title` for the metadata `title` field.
- Fixed `app/guides` to also pass `staticOgImage: pageData.ogImage` to `buildOgImageUrl` (was missing — causing per-page guide social cards to regress to generated cards).
- Fixed `WideSectionPage` to include og image and canonical (was returning only title + description).

ROLLBACK

Revert `generateMetadata` functions to their previous versions (remove `canonicalUrl`, `seoTitle` usage, and restore `...(canonical ? { alternates: ... } : {})` pattern). The old code is in git history.

FIX 03 buildPageUrl helper added to lib/og-url.ts

Ch.7

FILE

`lib/og-url.ts`

PROBLEM

No shared utility existed to construct absolute canonical URLs, leading to per-route ad-hoc string concatenation risk.

CHANGE

Added `export function buildPageUrl(path: string): string` that prepends `https://langfuse.com`.

ROLLBACK

Remove the `buildPageUrl` function from `lib/og-url.ts` and remove its import from all route files.

FIX 04 seoTitle and ogVideo fields added to frontmatter schemas

Medium · Ch.7

FILE

`source.config.ts`

PROBLEM

(a) The changelog schema was missing `ogVideo`, so all 50+ changelog entries with video frontmatter were silently dropping their `og:video` metadata. (b) No `seoTitle` field existed for pages that need a descriptive HTML title independent of their short sidebar label.

CHANGES

- Added `seoTitle: z.string().nullish()` to `baseFrontmatterSchema`.
- Added `ogVideo: z.string().nullish()` to `changelogFrontmatterSchema`.

ROLLBACK

Remove those two lines from `source.config.ts`.

FIX 05 ogVideo absolute URL handling in section page

Medium · Ch.7

FILE

`app/[section]/[[...slug]]/page.tsx`

PROBLEM

The previous code prepended `"https://langfuse.com"` to every `ogVideo` value. Changelog entries use absolute URLs like `https://static.langfuse.com/...`, so the concatenation produced broken URLs (`https://langfuse.comhttps://...`). Relative path entries like `/images/changelog/...` were handled correctly.

CHANGE

Added conditional: if `ogVideo` starts with `http`, use it as-is; otherwise apply `buildPageUrl`.

ROLLBACK

Revert the `ogVideoUrl` variable to the previous `"https://langfuse.com" + pageData.ogVideo` expression.

FIX 06 Descriptive seoTitle on 4 overview pages

Medium · Ch.7

FILES

`content/docs/observability/overview.mdx` `content/docs/prompt-management/overview.mdx` `content/docs/evaluation/overview.mdx` `content/docs/api-and-data-platform/overview.mdx`

PROBLEM

These pages had `title: Overview` which caused the HTML title to regress from production's descriptive SEO copy to the generic "Overview - Langfuse". The sidebar label should remain "Overview".

CHANGES

Added `seoTitle` frontmatter to each file:

- observability: `"Open Source LLM Observability & Application Tracing"`
- prompt-management: `"Open Source Prompt Management"`
- evaluation: `"LLM Evaluation & Testing"`
- api-and-data-platform: `"API & Data Platform"`

ROLLBACK

Remove the `seoTitle:` lines from each file.

FIX 07 H4 → H3 heading on prompt-management/get-started

P2 · Ch.6

FILE

`content/docs/prompt-management/get-started.mdx` line 100

PROBLEM

"Not seeing what you expected?" was an `####` (H4) heading immediately following `##` (H2) step headings inside a `<Steps>` component. This violated heading-order accessibility requirements (skipping H3).

CHANGE

Changed `####` to `###`.

ROLLBACK

Change `###` back to `####` on that line.

FIX 08 "Was this page helpful?" feedback widget added to FAQ / section pages

Ch.8

FILE

`app/[section]/SectionDocBodyClient.tsx`

PROBLEM

Pages served through `SectionDocBodyClient` with `withProse=true` (FAQ, handbook, security, etc.) were missing the `DocsFeedback` and `DocsSupport` footer widgets that `DocBodyClient` and `SectionDocBodyClientWithDocsBody` both render.

CHANGES

Added imports for `DocsFeedback` and `DocsSupport` from `MainContentWrapper`, and appended the feedback block after the MDX content in the `withProse=true` branch.

ROLLBACK

Remove the `DocsFeedback` / `DocsSupport` import and the three lines (`<hr>` + `<div id="docs-feedback">`) from `SectionDocBodyClient.tsx`.

FIX 09 FAQ index sidebar label changed to "Overview"

Ch.8

FILE

`content/faq/index.mdx`

PROBLEM

The FAQ overview page showed "Langfuse FAQ - Most Common Questions" as the left-menu label (long, not matching the "Overview" convention used across other sections). The descriptive title was preserved as `seoTitle` for the HTML `<title>` tag.

CHANGES

Changed frontmatter `title` from "Langfuse FAQ - Most Common Questions" to "Overview", and added `seoTitle: "Langfuse FAQ - Most Common Questions"`.

ROLLBACK

Revert frontmatter to `title: Langfuse FAQ - Most Common Questions` and remove the `seoTitle` line.

FIX 10 md-to-pdf route: explicit Node.js runtime + 60 s timeout

High · Ch.4

FILE

`app/api/md-to-pdf/route.ts`

PROBLEM

The Puppeteer-based PDF generation route had no explicit runtime declaration and no `maxDuration`. In Vercel preview deployments this can cause the function to be assigned to an incompatible runtime or hit the default 10 s timeout before Chromium launches.

CHANGES

Added `export const runtime = "nodejs"` and `export const maxDuration = 60`.

ROLLBACK

Remove those two export lines.

NOTE

If the preview deployment continues to 500 after this fix, the root cause is likely Chromium binary extraction failing in the specific Vercel preview environment (different Lambda layer or size budget than production). That would require investigating the `@sparticuz/chromium` version compatibility with the preview infrastructure.

FIX 11 Untrack .source/source.config.mjs from git

Ch.11

COMMAND

```
git rm --cached .source/source.config.mjs
```

PROBLEM

`.gitignore` already excludes `.source/`, but `source.config.mjs` was still tracked. Partial tracking of a framework-generated directory is confusing and breaks the "generated = disposable" contract.

CHANGE

The file is now untracked. `.gitignore` continues to ignore the entire `.source/` directory.

ROLLBACK

`git add -f .source/source.config.mjs` (re-track the file).

FIX 12 README updated to reflect Fumadocs + App Router architecture

Ch.11

FILE

`README.md`

PROBLEM

README still said "Based on Nextra" and referenced the old `pages/` directory for notebook output.

CHANGES

Updated the intro line to mention Fumadocs, updated notebook output path from `pages/` to `content/guides/cookbook/`, updated the Stack section to list Fumadocs instead of Nextra.

ROLLBACK

Revert the three changed lines in `README.md`.

Deferred Issues

The following issues were identified but NOT fixed in this pass. Each requires either environment-level investigation or a large architectural refactor that could destabilise the live site.

DEFERRED 1 Bundle size regression (Ch. 9 P1)

P1 · High

Preview ships ~5.7 MB vs ~0.83 MB in production. Root cause requires running `pnpm run analyze` and diffing chunk graphs. Likely candidates: Three.js (`@react-three/fiber` / `three`) or Nextra shim importing heavy client libraries on every route.

FIX PATH

Run bundle analysis, identify the offending import(s), add dynamic imports or move to server-only.

DEFERRED 2 Sitemap includes canonical/noindex URLs (Ch. 2 Medium)

Medium

126 pages with `canonical` pointing elsewhere + 1 noindex page appear in sitemap. Fixing requires reading all MDX frontmatter at `next-sitemap` config time.

FIX PATH

Add a `transform` hook to `next-sitemap.config.js` that skips pages whose frontmatter declares `canonical` or `noindex: true` , using a pre-built JSON manifest generated during the `prebuild` step.

DEFERRED 3 Inkeep search 403 on preview (Ch. 5 High)

High

Preview Inkeep widget returns `Error: (403, 'Not authenticated')` . This is a deployment-registration issue (Inkeep needs to allowlist the preview hostname).

FIX PATH

Register the preview deployment URL with Inkeep, or configure the Inkeep client to use a different API key for preview.

DEFERRED 4 Nextra compatibility shims still in use (Ch. 11 Medium)

Medium

~30 files still import from `nextra/components`, `nextra/context`, `nextra/hooks`. Removing them is a large refactor touching every imported component.

FIX PATH

Systematically replace each Nextra import with its Fumadocs or local equivalent, then remove webpack aliases.

DEFERRED 5 Multiple content registries (Ch. 11 High)

High

Parallel registries (`doc-loaders.client.ts`, `section-loaders.generated.ts`, `lib/source.ts`, `lib/sections.ts`) exist alongside Fumadocs's own source graph.

FIX PATH

Move body rendering directly onto Fumadocs `page.data.body`, eliminating the custom loader registry pattern.

DEFERRED 6 DocsLayout duplicated across 5 layout files (Ch. 11 Medium)

Medium

Shared options should be extracted into a single helper. Low risk but requires testing all section layouts after any change.

FIX PATH

Extract shared `DocsLayout` config into a `lib/docs-layout-options.ts` helper and import it across all 5 layout files.
